Application No. 10/582,096 Art Unit: 3633

## AMENDMENTS TO THE CLAIMS

The following listing of claims replaces all prior versions of claims in the application,

1. (Currently Amended): A pre-cast concrete block for constructing a staircase, comprising:

a horizontal stepping surface;

a rise surface perpendicular to the stepping surface; [[and]]

a rear surface which connects diagonally the stepping surface and the rise surface at

respective edges thereof, the rear surface having a recess for reducing the weight of the block,

the recess having a round part round parts with a specified radius at an inner corner part inner

eorner parts of the recess between an underside of said horizontal stepping surface and a rear

side of said rise surface; and

a pair of side surfaces constituting outermost sides of said pre-cast concrete block, each

of said pair of [[said]] side surfaces having a displacement prevention groove formed engraved

on an exterior side thereof,

wherein said round part forms the round parts form a partially cylindrical recessed

surface, [[and]]

wherein at least part of said pre-cast concrete block has a triangular shape in cross-

section, is a triangular pillar

wherein said displacement prevention grooves are formed in an L-shape with a horizontal

part and a vertical part, and

wherein said displacement prevention grooves have a triangular shape in cross-section.

- 2 -

Art Unit: 3633

2. (Previously Presented): The pre-cast concrete block according to claim 1, further comprising

a second recess for reducing the weight of the block, said second recess being formed in the rise

surface.

3. (Cancelled).

4. (Withdrawn): A method of constructing a staircase using the staircase block according to

claim 1 or 2, comprising the steps of:

a first step of laying a foundation mortar on the tamped face of the inclined land, and

temporarily placing the staircase blocks on the foundation mortar;

a second step of producing a gap between the rear surface of the block and the upper

surface of the foundation mortar by lifting the minimum angle side of the block by 3-4 cm with a

camber;

a third step of leveling the corner of the rise surface of the staircase blocks by hammering

it with a sand hammer while checking the horizon with a level placed on the front edge of the

stepping surface of the block;

a fourth step of adjusting the slant angle of the stepping surface of the block by pushing

and pulling the camber while checking the slant angle with a slant (a slant angle measuring

device);

a fifth step of filling-up uniformly the gap produced in the second step with mortar;

- 3 -

Art Unit: 3633

sixth and seventh steps of filling-up the trace of the withdrawn camber with mortar, and inserting joint filler into the gap between adjacent blocks; and

a final step of finishing the joint and completing the construction work by cleaning residual sands and dusts.
